London Drugs Pioneers One Hour Photo Finishing Uploaded To The Internet

CANADA NEWSWIRE

November 27, 1998

JOURNAL CODE: WCNW LANGUAGE: English RECORD TYPE: FULLTEXT

WORD COUNT: 445

Photo Station(TM) offers unparalleled photo service

VANCOUVER, Nov. 27 /CNW/ - London Drugs is pleased to introduce an exciting new development in one hour photo finishing. This new service will be offered by all London Drugs stores across British Columbia and Alberta by early December. This innovative photo service will further strengthen London Drugs leadership in providing digital photo finishing technology by loading a customers photos to the Internet in approximately one hour.

At London Drugs, a customer's roll of film is processed into prints and each picture is individually checked for quality. The new Photo Station(TM) provides customers with the additional option of having their roll of film loaded to a private album on the London Drugs Web Site (www.ldphotostation.com). Once the photos have been securely loaded to the Internet, London Drugs will e-mail a personal Roll ID code to the customer and create a hot link directly connecting the customers e-mail to London Drugs web site. Using the personal Roll ID code assigned to each roll of film, a customer and their family or friends can retrieve the photographs from anywhere in the world via the London Drugs web site. London Drugs Photo Station(TM) and its accompanying software, London Drugs Photo Point(TM), will be available in all London Drugs stores by early December, allowing customers to view, edit, enhance or duplicate any of their photos.

London Drugs is proud to have pioneered this new service. London Drugs Photo Station(TM) was originally tested by teaming up with the University of British Columbia where London Drugs donated photo finishing services to the UBC Department of Athletics and Recreation. London Drugs and UBC tested the full cataloguing and photo album storage access through the sponsorship of UBC's annual ``Day of the Longboat'' event in late October.

The University of British Columbia's David Thomson states, ``We were extremely impressed with London Drugs Photo Station(TM) service; the students loved it. We're looking forward to using this service for all our special events and sports activities. It will save us time and money.''

London Drugs looks forward to providing Photo Station(TM) service to all their customers. Using Photo Station(TM), customers can enjoy and easily share all of their special photos with family and friends around the world.

London Drugs and USC welcome you to view the photos from their ``Day of the Longboat'' event on the London Drugs photo web site at (www.ldphotostation.com). See UBC's Roll ID code numbers: E8LC2HUNVH; CQPPJBXR7C; C8GBDS8Q2F.

For further information, or to try out the new service, please contact Colin Boog (604) 880-6216 or Nick Curalli (604) 272-7176; [ncuralli\(at\)londondrugs.com](mailto:ncuralli(at)londondrugs.com)

/For further information: Colin Boog (604) 880-6216 or Nick Curalli (604) 272-7176; [ncuralli\(at\)londondrugs.com](mailto:ncuralli(at)londondrugs.com)/ 15:19 ET

Trailblazer London Drug serves up Internet Cafe, photo station.

Symons, Allene

Drug Store News, p83(1)

Oct 19, 1998

TEXT:

London Drug has long been known as a trailblazer in photo and electronics. A decade ahead of any U.S. drug chain, London had one-hour photo labs in all its stores by 1984.

Last year, London Drug was the first drug chain to open an Internet Cafe, a concept still in test. This fall, London is about to launch London Drug Photo Station, a proprietary service similar to Eastman Kodak's Picture Maker (part of the Image Magic family of systems) and Fuji's PicturePlus.

At the end of November, London will open its third Internet Cafe in a relocated store in Grand Prairie, British Columbia. Although the cafe is still considered a test, this store relocation provides an opportunity to expand the test, and it's just in time for new photo services.

Keeping shoppers in the store longer

The concept of the cafe "is driven by the fact that we need to keep people in the store longer, and we thought this would be a good way of doing it," explained John Vasconcelos, business unit manager of general merchandise, for London Drug. "The Internet stations are busy all day long. We only allow people a half-hour, to be fair to other people who need to access the Net."

At 32,000 square feet of selling space, the new location almost doubles the Grand Prairie store's size. The prototype 500-square-foot cafe has four personal computers, available for a use fee of \$3 for a half hour. There is also a printer where, for a small fee, a customer can print a document.

The cafe is managed by London's staff, whose training was provided by supplier Seattle's Best Coffee in return for an agreement to sell its coffee and accessories. Customers can also purchase other items, such as muffins, at the cafe.

"There are lots of possibilities for cross-promotions for the Internet Cafe," Vasconcelos said. Photo is a likely candidate, especially because of the latest offering, London Drug Photo Station.

Frank Tent, merchandise manager for the photo division and business unit manager for the one-hour photofinishing division, explained the many choices his customers will have now and in the near future:

London customers can choose to have a roll of film delivered to them via Internet, a service London has offered for two years. Because this is done in-house, it is faster than the service offered by competitors. "If a customer has requested [this service], by the time they get home they should find these images waiting on the Internet," Tent said

The customer can view the images on the Internet through London's web site, or she can distribute the roll ID number to friends or family, who then can download the images via London's site. Another option is to order one or more of these images as prints or enlargements.

The London Drug Photo Station, which will be in each store before Christmas, will enable London to provide instant print copies and print enlargements up to 12-by-18 inch-larger than those offered in competitor's print stations (although Tent expects 8-by-10-inch to still be the most popular size).

A print can travel the other way, too: From the in-store Photo Station, London staff can assist a customer in downloading an image from her Internet roll, and print it while she waits.

In those locations where London Drug had the Internet Cafe, she can even peruse the images on a PC and decide which ones she wants to print.

Future plans include photo gifts; by next year consumers will be able to view images at home, decide if they want one of their images on a T-shirt, mug or mouse pad and order it through London's web site.

Meanwhile, customers can have a cup of coffee, munch a muffin and check their e-mail. And, drug chains can look north to this bellwether chain for a glimpse of what's coming next in photo.

TEXT:

THE NAME **FUJI** is well known to people in many walks of life, including those in the graphic arts. But relatively few people outside Japan have a very good idea of how significant **Fuji** Photo Film Co. is in world markets. When suppliers of photographic consumables are considered, it is usually names like Kodak and Agfa that first spring to mind. However, **Fuji** not only is one of the largest and most significant suppliers in world graphic arts markets, it also is the leading supplier of printing plates in the world. Moreover, in the photographic film market, **Fuji** is second to Kodak in market share. It is also a leading supplier of camera and video products.

In the graphic arts, in addition to supplying plates and film, **Fuji** also supplies its Color Art system for color proofing and recently added digital cameras to its line. In fact, it was one of the first companies to enter this market. In addition, **Fuji**, with DuPont, is co-owner of Crosfield Electronics and distributes Crosfield's products in many parts of the world.

One thing that isn't generally known is that **Fuji** is a manufacturer of its own color scanners, color systems and imagesetters -- items that aren't exported outside Japan.

At Drupa, where we looked at **Fuji**'s products and discussed the company's strategy, we were quite impressed, but we felt that **Fuji** hadn't yet recognized the full potential that we saw in its new products. So we were delighted to receive an invitation to attend **Fuji**'s CES World exhibition in Tokyo in November. We decided to use the opportunity to find out more about the company, its products, its plans and its position in the graphic arts.

This report covers what we saw in Tokyo. After describing the company and how it is organized, we'll look at some of its innovative products that relate to the graphic arts. Some of them have evolved from unique **Fuji** Photo Film technologies that are being developed further to provide advanced products for specific market slots.

Among the product highlights are the following:

- * Digital proofing. The First Proof color proofing system uses **Fuji**'s Thin Layer Thermal Transfer technology to produce sharper, more controllable color images than dye-sublimation printing produces.

- * Dry imagesetter. **Fuji**'s Chemical Free Film, which uses **Fuji**'s unique Pictography technology, could become the most significant of the new "dry" imagesetter films when it is introduced during 1996.

- * Digital cameras. The Fujix DS-505 and DS-515 digital card cameras, codeveloped with Nikon, provide what is perhaps the closest match to a conventional camera of all the professional digital cameras.

The company

Fuji Photo Film, which was founded in 1934 and entered the graphic arts in 1956, comprises three groups operating in different markets: Imaging Systems, **Photofinishing** Systems and Information Systems.

Imaging Systems, which accounted for 36.4% of the overall **Fuji** Photo Film turnover in the 1994 financial year, covers print and slide film for amateur and professional photographers; film with lens products (throwaway cameras); cameras; and camcorders. The range of products is huge, and the number of unique **Fuji** innovations is substantial, but none of these will be included in this article.

Photofinishing, which generated 22.7% of **Fuji** Photo Film's 1994 turnover, includes color print paper and a wide variety of minilab systems

-- not covered here.

The third and largest division, Information Systems, generated 40.9% of 1994 turnover. It comprises not only graphic arts, but also medical imaging, office automation, computer media and miscellaneous industrial materials. Graphic arts generates a large share of Information Systems' turnover.

Fuji Xerox. **Fuji** Photo Film has other interests, a key one of which is co-ownership with Xerox of **Fuji** Xerox. This partnership -- which will become increasingly significant with the growth of digital printing -- has produced the Xerox Majestic and Regal color copiers and the 40-ppm color print engine used in the Scitex Spontane digital press. This engine also is a part of **Fuji** 's new Color on Demand printing systems announced in Japan.

Sales. In 1994, 62.2% of the company's total sales came from the Japanese market. The total value of consolidated worldwide sales in 1994 amounted to \$10.885 billion. Sales in 1994 were down slightly from 1993, but since 1990 **Fuji** Photo Film has seen zero growth; sales in yen were almost the same in 1990 as in 1994. The split between home and overseas sales also has stayed about the same.

At the same time, the company has seen a drop in profitability, recording net income after tax of 63.7 billion yen in 1994, compared with 90.2 billion yen in 1990. (Net income in dollars in 1994 amounted to \$650.7 million.) In that time, however, assets increased, and debt and liabilities decreased. Thus, while **Fuji** is like its competitors in experiencing a decline in revenues from traditional products, it has yet to see the new-technology digital products generate substantial revenues to replace the revenues from conventional film.

It is interesting that in this area the company looks very strong, with almost \$6 billion (U.S.) of cash or cash equivalents as part of its current assets. So it is poised to move into new market areas as opportunities arise.

R&D. **Fuji** spends in the region of \$2 million per day on R&D. Within the graphic arts markets, the key areas of development are chemical imaging, which involves silver-halide, photopolymer, thermal-transfer and associated chemistries; electronic imaging, which comprises the application of laser, CCD and specialized optics; and imaging software, which includes color management and image analysis.

The current emphases in the graphic arts are in the following areas: image capture, data management, color proofing, film imagesetting, platemaking, color management, digital printing and environmental support.

Environmental protection. During our visit to **Fuji** , we had the opportunity to observe several business areas to check the quality of manufacturing operations and the sophistication of R&D. Included were visits to the Miyanodai Technology Development Center and the Ashigara photographic film factory, where we saw a very strong commitment to the environment. It is notable that every division has a director in charge of the environment, reporting directly to the president.

Environmental protection is practiced throughout **Fuji** operations. For example, the use of all chlorofluorocarbons in solvents and cleaners was terminated throughout the organization in 1993.

The most obvious demonstration of environmental support is probably at the Ashigara photographic film factory, which uses about 60,000 tons of spring water daily for the production of film. This water is taken from springs close to Mount **Fuji** . Most of it is used for air conditioning as the air is cleaned and maintained at a certain temperature. Water that is used in the production process is fed to the general waste-water processing facility, where it is cleaned by means of bacteria in an activated sludge system.

After the water has gone through careful processing, which takes about 24 hours, it is discharged into a river. Before this happens, it is carefully inspected at many locations. The final and most spectacular inspection point is a giant carp pond called the Colored Carp Park, where 20,000 carp are being raised and some have exceeded 15 years in age. The sight of these vividly colored fish swimming vigorously is an indication of the quality of the water.

Another example of environmental support is the Fujicolor Quicksnap disposable cameras. After these units are turned in for **photofinishing** , they are collected and sent to five recycling centers in Japan. In

addition, since 1991 **Fuji** has operated an exchange system with other manufacturers to support recycling.

Products

Fuji has a broad range of products, only a few of which we will cover here. We will focus on the ones that use the most innovative technologies, which we think show important company directions for the future. These products are all digital. We won't consider conventional products such as the analog Color Art color proofing system, which is regarded by many people as one of the best, if not the best, analog proofing systems available.

Printing, Proofing, Film Output

Fujix Pictography 3000

Fuji has developed a unique, photothermographic technology that is the basis of the Fujix Pictography 3000 color printer. This is a photographic-quality digital printer for printing images from digital cameras or, with a different color-calibration setup, for use as **Fuji**'s FirstLook color proofing system (except in Japan). It is a continuous-tone, 400-dpi color printer that images a maximum image size of 11.77.inch x 8.59.inch (299x218mm) on glossy or matte, standard or lightweight paper, or on clear overhead transparency material. The maximum resolution is 4,709x3,431 pixels.

The technology, introduced in 1987 with the Pictography 1000 system, has been enhanced continually since then, increasing both speed and image quality.

Dry-silver imaging. As noted, the Pictography technology and process are unique to **Fuji**. The process involves two materials -- a donor and a receiver -- and uses silver-halide materials. However, the system requires no wet chemical processing and delivers a finished, dry color print.

The key to the imaging technology is **Fuji**'s photothermographic material, which contains all of the necessary processing chemicals to develop the image, which means that the development process requires simply supplying moisture and applying heat.

The process. The process begins with the printer cutting the required amount of donor film from the feed roll. This material is then imaged using three laser beams -- one for each color. After imaging, the donor film is moistened to enhance development, and the image receiving material -- either paper or transparent overhead projection film -- is cut to the specified print size.

The donor material and the receiver material are brought into close contact as heat is applied. This develops the donor film, causing a dye-release transfer of the image to the receiver material. The donor material containing all the chemicals is then peeled away. The receiver material, now sporting the high-quality color image, is dried and delivered in the unit's delivery tray.

The technology. The key to the donor material is the Dye Releasing Redox (DRR) compounds, which have a nondiffusible redox part and a diffusible dye part. When these are heated in an alkaline solution, the compound reduces the silver-halide grains with the latent image formed by the exposure, and releases a diffusible dye. This dye is transferred to the receiver with the aid of a small amount of water, and is then fixed on the receiver. Each DRR compound in each layer of the donor contains a cyan, a magenta and a yellow dye, respectively. The system is set up to allow the three colors to be imaged by three separate diode lasers, each operating at a different spectral wavelength: 680, 750 and 810nm.

In the imaging process, the three separate diode lasers are projected via a polygon mirror onto the donor film at the same time. **Fuji** has developed special-facet, tilt-error compensation to ensure very accurate placement of dots onto the donor material. The system, which handles PostScript data, can produce 256 gray levels for each of the three colors, giving a total of 16.7 million color shades. Within the control system are options to work in RGB or CMYK color spaces. For CMYK use, the printer is sold by **Fuji** Photo Film as the FirstLook color proofing system.

Quality. The quality we saw from the Pictography 3000 was excellent, at least comparable to that of dye-sublimation printing. It also is able to represent color printing of photographic image quality similar to that of conventional film prints.

Proofing weaknesses. In a color proofing mode, the machine suffers from three limitations:

* Size. At a maximum size that is a fraction larger than A4, it is too small for many color proofing needs.

* Material. It prints only on a special material, in the same way as a dye-sublimation printer, rather than onto the real print stocks.

* Dotlessness. In the same way as all low- and medium-cost digital color proofers, it doesn't show real printing dots. However, it does have a software capability that can simulate potential print problems such as moire or too much color. (We have not seen this facility in operation, and thus won't comment on how effective it is.)

In perspective. The Pictrography is a very impressive, fast, high-quality color printer. The first print appears in around two minutes; subsequent copies of the same print take about 70 seconds. It provides high resolution (400 dpi, or 15.7 dots/mm) and a smooth gradation for each component color, providing support for 16.7 million shades of color to interpret an image. This density modulation is performed for every point of the scan line, so there is no tradeoff between gradation and resolution.

All colors are imaged in a single pass, unlike the three- or four-color pass used in dye-sublimation printers, thus ensuring accuracy without color shifts. The control system, which runs in a Macintosh and uses the **Fuji** PictroScript interpreter (based on Harlequin software), enables color adjustments and gradation control to be performed at any time, with hue and saturation control from the host computer.

The standard system includes a closed-loop, color-calibration system with auto calibration to support a standard setup from a supplied color target.

The system is attractively priced at \$29,900 in the U.S., including the PictroScript RIP.

Digital Color-Art First Proof

Quality digital proofing has been getting a lot of attention lately, with capable new products at various price levels. We reported recently on the DryJet from Polaroid, which costs \$35,000 and uses ink-jet technology. Scitex's Iris line has been coming down in price to approach this level. The latest competitor here is **Fuji** 's new Digital Color-Art First Proof, which was previewed at Drupa and will start shipments in the second quarter of 1996 at a price of less than \$35,000.

The First Proof is an A3-size printer with a maximum image size of 12.125.sup.2 x 19.625.sup.2 (309x500mm). Thus, it prints a double-page spread with full bleeds, using real printing stock, rather than the special, usually glossy, paper used by many other printers in this price range. Its key advantage, however, may be the combination of the quality of its proof and its ability to match real printing inks. It uses another unique **Fuji** Photo Film technology -- thin-layer thermal transfer.

Technology. The First Proof has a special ribbon that carries donor colors. It uses the same color pigments as the Color-Art analog proofer. Similarly to a dye-sublimation printer, the First Proof has a thermal head. It images at 300 dpi, one color per pass, transferring the relevant pigments from the ribbon onto a receiver sheet.

Once the first color has been transferred, the other three follow successively, to the same receiver sheet. This sheet is then manually moved to the built-in laminator. Here the image is transferred to the actual printing stock by peeling off the base sheet of the receiver and causing the color image to adhere to the stock.

One key advantage of **Fuji** 's thin-layer, thermal-transfer technology is that it transfers a hard spot of color, whereas the spot transferred by dye-sublimation printers has soft edges. (Dye-sub printers also use special printing papers.)

Observed under a magnifying glass, First Proof proofs show a definite screening pattern made up of small, hard dots, which differ very much from the soft dots of dye-sublimation and ink-jet proofs. This characteristic helps **Fuji** set up the First Proof to simulate print conditions.

The print control system also has some special capabilities for controlling the placement of dots.

Prospects. All of this takes place in one unit, which is driven from a Macintosh running an Adobe PostScript interpreter and **Fuji** color management.

The price of the unit hasn't been finalized, but it will be less than \$35,000 -- a very competitive price for the capabilities.

Based on what we have seen so far, the First Proof proofing system may

be a breakthrough product. With the exception of not showing actual printing dots, it is identical in most respects to the very expensive Kodak Approval, which uses a high-power laser to image hard donor dots onto a transfer material, which is then laminated to the real printing stock in a separate unit. (The Kodak Approval 2 slated for release in 1996 differs from this in that it does not image onto a transfer material and then onto the print stock, but images just onto one of two special papers).

The quality of First Proof proofs is perhaps the best we have seen from any unit selling for less than \$150,000. We asked **Fuji** what would be required to show the real printing dots, and the answer was a very high-power laser operating at a resolution of in excess of 2,000 dpi. The material would be identical, but such a product would cost substantially more than the First Proof.

NC-500 Digital Printer

The third new color printing system from **Fuji**, shown for the first time at Comdex in November, is targeted at users of digital cameras. Called the Fujix NC-500 Digital Printer, it is a small, tabletop unit that requires no ribbons, ink cartridges, toner or developing solution. Instead, it uses **Fuji**'s Thermo-Autochrome (TA) technology based on a heat-sensitive color-synthesizing process.

It prints on a special paper comprising five layers: a protective, heat-resistant layer on top, followed by three layers for yellow, magenta and cyan colors and a base layer.

Imaging technology. The yellow layer reacts to low levels of thermal energy to generate the yellow portion of the image. The entire print is then irradiated by a UV lamp, which fixes the color by decomposing the undeveloped color elements in the yellow layer, thus destroying their color synthesizing properties.

The magenta layer then reacts to the midrange levels of thermal energy to generate the magenta portions of the image. Then, following the same pattern as happens to the yellow, the entire print is irradiated by a UV lamp to fix the color by decomposing the undeveloped color elements in the magenta layer, destroying their color synthesizing properties.

Finally, a similar process takes place with the cyan layer, which reacts to the high levels of thermal energy to generate the cyan portions of the image.

Imaging is at 300 dpi and supports 256 levels of gray for each of the colors, producing a full 16.7 million colors. The print time is around 130 seconds for a maximum-size, 8.5x11 inch image area, which is imaged from a 24-MB frame memory.

Quality issues. We didn't have time to test this system, but **Fuji** Photo Film claims that its color reproduction and gradation capabilities rival those using silver-halide technology. We were able to take a picture with the small Fujix DS-220 digital camera and print it on the NC-500. The print looked reasonable, but we couldn't compare it with prints from the Pictography 3000 because we had used a different camera -- the Fujix DS-505 -- for these pictures. The DS-505 is of a much higher specification and cost than the DS-220.

The NC-500 will be available this spring for around \$8,000. A smaller, 150-dpi version printing A6-size images (5.875x4.125 inch) will sell for around \$600.

'Dry' film for imagesetters, scanners

Another output product using innovative technology is **Fuji**'s Chemical Free Graphic Arts System, which follows one of the budding trends from Drupa. Out of many so-called dry-film products shown first at Drupa, two -- those from Polaroid and Kodak -- have begun customer shipments. But both require a specially built imagesetter with a high-power laser. A third dry product -- Xerox's Verde Digital Film -- has been demonstrated, but it isn't yet available in sufficient quantities to be a viable product.

In that perspective, **Fuji** is in an enviable position. The technology it showed at Drupa had all the promise of the competitors, with the advantage of running in standard, unmodified imagesetters. At Drupa, **Fuji** said it had yet to formulate plans to market the film, but it was sounding out the market to evaluate its acceptance. **Fuji** showed the same film at Seybold San Francisco, still without a product announcement.

However, at the CES World event in Tokyo, **Fuji** Photo Film announced that it would introduce its Chemical Free Graphic Arts Film to the market in 1996. No dates or prices were given, but we were told that pricing would

be comparable to that of conventional film after taking into account processing costs.

Technology. The **Fuji** product is a little hard to categorize. Technically, it is neither dry nor chemical free because it uses water and chemicals provided on an extra sheet applied after imaging. Nor is it silver free, since the film is manufactured with silver halide, or processor free, since it requires a **Fuji** -developed processor. But it does conform to the major requirement of this new generation of film products: It requires no deep-bath chemical processing. And in that sense it is probably appropriate to call it a dry film.

Fuji specifies the film's Dmin as 0.15 and Dmax as 3.5 plus -- both very acceptable figures, and not surprising because the film is based on silver halide. However, rather than using conventional silver-halide processing, it uses technology similar to what forms the basis of the Pictography 3000 color printer, where film is developed using heat and moisture. Two key differences from the Pictography 3000 are that the dry film uses a single silver-halide layer rather than three dyes, and it is imaged at much higher resolutions.

Developing. **Fuji** 's dry film is imaged in an imagesetter or scanner exactly the same way that conventional film is imaged. The film is developed in a special **Fuji** processor, which hasn't been priced yet; however, **Fuji** says it won't be expensive.

The processing phase is relatively simple:

- * Preliminary steps. A very small amount of water is applied to the film as a very fine spray. A processing sheet is placed on the film and heat is applied at about 70-80(degrees) C.

- * Chemical action. Picolinic acid guanidium disperses from the processing sheet to the film and reacts with zinc hydroxide incorporated in the film to produce an alkali. Activated by the alkali, the development agent incorporated in the film develops the silver halide in the exposed areas. The silver halide in the exposed areas is dissolved by a solvent.

- * Removal. The action of the developing agent causes the silver halide to accumulate in the processing sheet, thus removing it from the film. At the same time, leftover silver images and other unnecessary elements also migrate from the film to the processing sheet. The processing sheet is automatically peeled off to complete the processing.

The resulting image is highly stable with an excellent density range. Moreover, as we noted, the process seems to conform to the requirements of most people concerned with the hazards of using conventional silver-halide film. **Fuji** 's film uses no separate chemicals, and the used processing sheets can be easily disposed of without processing. It requires no plumbing of a film processor, which means that the imagesetter and processor can be employed easily in an office environment.

And, most significant for some prospective users, the film is compatible with all existing imagesetters, without modification, except for the disengagement of any existing **online** film processor. The **Fuji** processor for the Chemical Free Graphic Arts Film will be available in an **online** type and a stand-alone unit that requires only loading and unloading the processing sheet material and changing the water supply bottle at infrequent intervals.

Market position. The aspect of Chemical Free Graphic Arts Film that is unique among the current round of dry products is that it runs in standard, unmodified imagesetters. Also significant is that it appears to support a quality comparable to that of conventionally processed, silver-halide films.

From a competitive standpoint, it offers an advantage over the two products already on the market. The Kodak dry film can be imaged only on an imagesetter developed specifically for that film, and at this stage only Dainippon Screen makes such an imagesetter. Similarly, the Polaroid film can be imaged only by a dedicated special imagesetter; at this time and certainly until late in 1996, only the Linotype-Hell DrySetter can image the film. In the case of the Xerox Verde Digital Film, the imagesetter must be modified to accept the film. Verde also has a lower density range than what printers are used to working with, which is hindering its market acceptance. Currently very few imagesetters have been adapted to image Verde materials, although a lot of manufacturers have expressed an interest in becoming compatible.

The other competitors are farther away from the market, although 3M

got its DryImage technology to the beta stage before pulling back its support. It is working on a new material that shows more promise, but no target availability date has been announced.

The **Fuji** product has some other features that will affect its market acceptance. On the negative side, unlike the Kodak and Polaroid materials, it is sensitive to light. It will require either supply by **Fuji** Photo Film in cassettes ready for loading directly into the imagesetter or a darkroom for loading.

On the positive side, a user doesn't have to commit to an imagesetter that can accommodate only one type of film. The imagesetter using **Fuji** materials is still able to use conventional film, so the purchaser isn't totally reliant on one supplier or one technology.

If the pricing is right and no glitches appear in the implementation of this innovative technology, this Chemical Free Graphic Arts Film should be a very attractive product when it comes out.

Digital Input Systems

In the field of digital cameras, **Fuji** was one of the first companies to enter the market, and it has been supplying units for many years. We first saw one in 1992, when the Fujix HC-1000 studio camera was introduced. It has since been adopted by Crosfield as its Celsis 160. At about the same time the HC-1000 came out, **Fuji** unveiled the Fujix DS-100 Memory Card Camera, which was perhaps the first point-and-shoot digital camera.

Both these models have recently been superseded, and **Fuji** now has a full, modern range of digital and video cameras, as we will describe in this section.

DS-505/DS-515 Digital Card Cameras

In a joint operation with Nikon, **Fuji** has developed the DS-505 and DS-515 Digital Card Cameras, which incorporate almost the same functions as the Nikon F4. The difference between the two is that the DS-515 can shoot in a continuous mode of three frames per second for up to a total of seven frames. Apart from that, the two cameras are identical. They are compatible with Nikon lenses, flash attachments, remote shutter releases and wireless remote-control accessories.

Each camera is a single-lens reflex unit storing images on a PCMCIA card. Each card holds 15 MB of data, or up to 84 frames in JPEG-compressed format. **Fuji** claims that the camera is unique among digital SLR cameras in that the entire viewfinder area is used to show the image. This is made possible by condenser optics that enable the CCD to capture the whole viewfinder image in its 1,280x 1,000 pixels.

Another benefit of the special condenser optical system is that it increases the concentration of light relayed to the CCD, achieving an effective equivalent of an ISO 800 film speed. This can be enhanced to 1,600 with a selector switch, which makes it feasible to shoot indoors or in poor light without a flash. The camera has a built-in aperture-control unit for exposure accuracy. Aperture control is entirely within the electronics of the camera; it is not set up using the lens aperture ring, which is left at the minimum f-stop position.

The camera has an electronically controlled focal-plane shutter with speeds under manual control of 1/2,000-1/8 seconds, and under automatic control of 1/2,000-1/2 seconds. With flash synchronization, the maximum shutter speed is 1/250 second. The aperture range is f6.7-f38. However, because of the technologies used, these figures do not compare exactly to those of standard, film-based SLR cameras, and the f6.7, when looking at the ISO 1,600 film speed, is effectively the same as around f2.8.

Storage capacity. These are more than just digital cameras; they also have substantial computing capability built into them. Images are automatically saved either uncompressed or in JPEG format in a range of compressions. Available formats, with their storage capacity on a Fujix HG-15 Image Memory Card, are the following:

A control on the camera allows for changing the compression mode at any time. Different formats can be used on the same disk concurrently.

Images are read into a Macintosh or PC from the card using a standard card reader, as in the latest 5000 Series PowerBooks. **Fuji** also offers the Fujix CR-500 PC Card Reader for connecting a PC or Macintosh via a SCSI port. This reader has two card slots and will read ATA Type I, II and III cards. (An ATA card is a high-speed memory card complying with the PCMCIA card specifications.) The file format on the card is compatible with MS-DOS file management, which means that image data can be transferred directly to

a personal computer without the need for file conversion. Done through a Photoshop plug-in, this allows the thumbnail of the image, which is created directly by the camera when the image is shot, to be seen in the Photoshop menu. The image is then read in, decompressed in the process, so every image, however it was compressed, is shown as 3.3 MB in size.

Playback. Another nice function of the Fujix Card Cameras is a built-in playback function, which enables a video monitor to be connected to the camera to view images without an external computer.

Market positioning. The Fujix DS-505 and 515 are high-specification digital cameras, suited to a number of market areas:

- * Publishing-related applications such as photojournalism, where the cameras are ideally suited for late-breaking news photography. Here the cameras compete with both the Kodak 420 camera, which is similarly priced, and the higher-priced Kodak 460, which has a higher-resolution CCD.

- * Medical imaging, where the video playback capability shows an image immediately to other doctors or to a patient.

- * Photomicroscopy, where they can be equipped with special microscopic adapters.

- * Studio portrait photography, where framing and composition can be confirmed immediately through the video playback. Images can then be output on a printer such as a Pictography 3000. At the **Fuji** CES World exhibition in Tokyo, the camera was being used in this mode to take pictures of senior Japanese print executives with Miss Japan International. (Naturally our European editor, a model of international politeness, agreed to have his picture taken with Miss Japan International.)

We will have more to say about the Fujix DS-505 camera after a few months, based on some testing we plan to do with a unit. Our first few days of the test confirm its ease of use. The quality of images appearing in Photoshop appears to be good, but we have yet to print any of our pictures.

DS-220 Digital Card Camera

Fuji has just introduced the Fujix DS-220 Digital Card Camera to replace the DS-100 Memory Card Camera first shown in 1992. It is **Fuji**'s entry-level digital camera, targeted to compete with the Kodak DC 40. It is a complete digital camera built by **Fuji**, without camera components from another manufacturer. It uses the same type of PC card as the DS-505 and 515, but it will take cards of 2-, 5-, 15- or 20-MB capacity. The image resolution of 640x480 pixels is lower than the DS-505's.

As with the larger camera, this one automatically compresses images into JPEG format. At the highest compression it can store 40 images on a 2-MB card. The shutter speeds range from 1/4 to 1/1,000 of a second and apertures from f 3.5 to f 11. The lens is a two-step zoom with macro, which is the equivalent of a 36/72mm conventional camera lens. The ISO rating is 120/240. The camera comes with a built-in flip-up flash.

The camera provides video output and playback facilities directly from the PC card, in the same fashion as the DS-505. As an option, the PA-D22 LCD color monitor can be connected to the camera to allow an immediate check after an image has been taken. Extra lenses are available for macro and wide-angle photography.

The Fujix DS-220 sells for around \$1,500. In the entry-level digital camera market, it appears to be an impressive product, particularly for capturing images for presentations and for distribution in documents on the **Internet**. The resolution is the same as that of the PC VGA standard, so the quality for screen images, or images printed at resolutions of around 600 dpi on computer printers, looks fine. The resolution is not high enough for professional-quality photography, but that market is served by other Fujix cameras.

HC-2000D digital camera

Fuji has updated its HC-1000 camera, also sold as the Crosfield Celsis 160. The new HC-2000D doesn't replace the HC-1000, but provides a model supporting additional functionality, enhanced performance and higher quality.

The HC-2000D is a studio camera with a maximum shutter speed of 1/2000 of a second and ISO speed equivalent to 40, 80 or 160. It uses three 1,280x1,000-element CCDs, 10 bits deep to capture 1,024 gray levels. This generates a file size of 3.6 MB, which is interpolated through specialized A/D conversion to produce a 14-MB file.

Like the HC-1000, the 2000D can be fitted with a range of Fujinon lenses.

Control unit. The HC-2000D has its own camera control unit, rather than being controlled from a separate computer such as a Macintosh. Images can be stored directly onto an optional magneto-optical disc drive, from where they are transferred to a Macintosh or PC for subsequent manipulation, or the control unit can be interfaced directly to a Mac or PC via a SCSI link. An optional video monitor can display the latest shot before images are transferred to disk or to the linked computer.

The control unit also handles the synchronization of flash units for studio photography.

Suited for catalog work. The Fujix HC-2000D is a significant development over the earlier unit. It overcomes some earlier obstacles to becoming a key competitor in the studio market. The higher shutter speed makes it suited for moving images, and the use of interpolation on the 30-bit file to generate a higher resolution file appears to make it suited for catalog photography of both still and moving images.

The camera is priced at \$23,600.

Fotovision FV-10

At the opposite end of the market from the high-quality digital cameras is Fotovision, a video-capture device for inputting 35mm color slides, reflective copy or even 3D objects into a video format for display on-screen. The FV-10 is a compact unit, about the size of a VHS video cassette. It can accommodate a reader for 35mm slides or a stand for tabletop mounting to read in either reflective copy or 3D objects. It connects directly to a computer, such as a Macintosh AV model, or to a video monitor.

We envision the FV-10 as a good product for use on the **Internet**, where it can capture images for inclusion in documents for transmission via the World Wide Web. It may be suited also for publications such as real-estate or car listings, where small images are printed at relatively low quality, or where small images are included in reference **databases**. The FV-10 currently is available only in Japan, where it is priced at an equivalent of around \$800.

Digital Card Reader

Fuji has developed a portable PC card reader, called the HT-200, to allow images shot on DS-505 and DS-220 cameras to be transmitted over telephone lines without needing a portable computer. This small unit, which is not much larger than a cellular telephone, allows for selection of an image or images from the card, and transmission of the image, which can be to a digital cellular telephone to allow photographers to operate in a totally independent manner.

Digital Imaging Film and Plates

Photopolymer plates

In the expanding CTP market, **Fuji**'s newest plate is the High Speed Photopolymer Laser Plate System. Sensitive to argon-ion lasers (488nm wavelengths), it has as high a specification as any of the photopolymer plates currently on the market. **Fuji** quotes a resolution of 175-lpi screens, with 2%-98% density range. These are probably conservative figures concerning screen values.

While we were in Japan, we saw the results of the first installation of the Crosfield Celix 8000 CTP platesetter. It was using **Fuji**'s High Speed Photopolymer Laser Plates to produce superb results at 200-lpi screen frequencies. The job was of a school yearbook with more than 170 small, color images on an eight-page plate. The parts we studied were in full registration and showed no signs of moire or other artifacts.

The High Speed Photopolymer Laser Plates currently are being shipped only in argon-ion sensitivity format. **Fuji** is working on a version for frequency-doubled YAG lasers, which is expected to be available during 1996. The argon-ion plate has a water-based developer. The plate processor currently available measures 850mm wide. A 1,250mm processor is under development.

Hybrid-type plates

Fuji has been marketing its hybrid plate for some time, and it may have been the first company to develop a hybrid plate. (The Polychrome CTX is also this type of plate.) **Fuji** says the plate supports screen rulings up to 300 lpi and a density range of 2%-98%. **Fuji** currently offers a 1,250mm-wide plate processor. An 850mm-wide processor is under development.

Rapid-access film and paper

In the same way as other major suppliers of consumables for

imagesetters and scanners, **Fuji** Photo Film is continually improving its products. It has just introduced new versions of its films, papers and associated consumables, the Fujifilm HQ and HR rapid-access film and paper. These materials are stated to require less chemistry in processing than competitive products, and to provide a very high image quality.

Research

Much of what **Fuji** showed us comes from its internal research groups, which provide one of the company's key strengths. **Fuji** has five main research centers in Japan, each specializing in a different market area. On our visit to the Miyanodai Technology Development Center we saw work on products for the graphic arts and medical imaging, but, as most forms of data move into the digital area, much of the research being done could be applied easily to other markets. The Pictography technology, which is of increasing importance in graphic arts (note the First Proof proofing system and the Chemical Free Film), was developed more for the **photofinishing** market.

Radiography. One of the most interesting technology demonstrations we saw was aimed at medical imaging. This Computed Radiography project, we were told, represents a major advancement in radiography technology. It enables the use of conventional x-ray equipment, but instead of film and screen, a special plate called the Imaging Plate (IP) is used. This plate uses newly developed photostimulable phosphors to detect x-ray information and store it as energy within the phosphor particles. This application provides high sensitivity, high sharpness and low noise radiographs for diagnosis.

This plate is then read into the **Fuji** FCR 9000 system, which is a computer-controlled imaging and display system that provides a digital display and diagnosis. It allows x-ray images to be read at workstations around a hospital or medical center, but it allows for substantial improvements in diagnostic capabilities.

Because of the much higher sensitivity of the **Fuji** Imaging Plate, far lower levels of x-ray exposure can be used, with the subsequent benefits that provides. This technology also allows for different views to be taken from a single image, by identifying different signal levels that can be generated from bones and tissues.

The system has two separate image-processing methods -- one to resemble conventional screen film images and the other to show anatomical detail.

While this application is unrelated to the graphic arts, it provides an example of the versatility of **Fuji** 's capabilities in the development of special technologies, plus its expertise in specialized image processing. Both of these areas are very applicable to the development of graphic arts products.

Imagesetters. Other interesting R&D work at Miyanodai included the design and implementation of new imagesetters. We saw work on the new **Fuji** Luxsetter, but we understand the technologies are also being used to assist Crosfield in the implementation of its Celix imagesetter products.

The work involves advanced computer-aided design and operating simulation. It takes CAD designs of the imagesetter and applies stresses to it, such as simulating vibration from the spinning optics or motors. Then modifications can be made to the CAD design and the test rerun.

We were told that the **Fuji** Miyanodai research staff and the Crosfield staff regularly transfer information on a variety of products.

Other products. Other products we saw being worked on included a new Sparcstation-based color page makeup system. The development atmosphere in Japan is still quite different from that of North America and Europe, where desktop publishing has had a huge effect on high-end color systems.

In Japan, most color page makeup is still done using scanned data. The new **Fuji** system, designed for this type of work, takes input from all **Fuji** 's input systems, which include Crosfield scanners and **Fuji** Luxscans, and outputs to Crosfield and **Fuji** imagesetters.

Conclusion

The graphic arts world has been undergoing rapid change for many years, which has forced change among its key suppliers. Through much of the world, the latest catalyst for the most recent change has been the revolution in computing, as desktop technology wreaks havoc on traditional practices, extending beyond applications to profit margins and distribution methods.

In Japan, the computing revolution has had a much smaller effect on the graphic arts, but nevertheless there has been real change. One of the areas in which change has accelerated is in the chemical business, where suppliers of consumables to the graphic arts are feeling the effects of change. Product life spans are decreasing, and the digital world is posing real challenges to the future.

As a result, the key consumable suppliers are evaluating how to capitalize on such changes. We see them moving more into the supply of digital systems. For **Fuji** and Kodak, this has meant an emphasis on the development of digital cameras, whereas Agfa has relied on camera suppliers for its digital cameras.

All of these suppliers are pondering the future of film as an imaging source for printing. How quickly, if ever, will it be replaced by computer-to-plate and direct-to-press technologies? Then, of course, there is the challenge of the ultimate "direct-to" technology: publishing direct to the consumer via the **Internet**.

From what we saw in our brief visit to Japan, **Fuji** is as well set up as any of its major competitors to answer the challenges of the future. Its strengths are its dominant position in the Japanese marketplace and its unique, innovative technologies.

Outside Japan, **Fuji** has an obstacle in the high cost of its products because of the strength of the yen. It also has problems resulting from its part ownership of Crosfield.

Crosfield quandary. The problem with the Crosfield deal starts with the distribution strategy for Crosfield's products. In this partnership, both **Fuji** and DuPont contribute toward the development of products by Crosfield. However, DuPont's distribution arm is far stronger than **Fuji**'s in the West, so it is difficult for **Fuji** to come up with a good strategy to compete with DuPont, which has comparable products. Moreover, **Fuji** can't use the Crosfield operation to develop unique products because such products will get into the hands of its major competitor, DuPont.

In fact, the complexities of joint ownership of Crosfield were probably never envisaged when the joint acquisition took place. Both companies have sunk huge investments into Crosfield, so far with little return, apart from the products they are now able to ship. Unfortunately, similar, or in some cases better, products probably could have been available to both DuPont and **Fuji** through OEM channels at a much lower cost.

The good news for both companies is that Crosfield's new restructuring has made it solely an R&D and manufacturing company. As a result, Crosfield won't need the huge levels of investment of the past.

Well set. Despite the Crosfield situation, we see **Fuji** as well set for the future. It has some very significant products that appear to be in a position to establish strong market positions. It also has another, very significant co-ownership -- **Fuji** Xerox -- whose technologies are already becoming a major force in the copier and laser printer markets in Japan. With the growth of color printing, the co-ownership of **Fuji** Xerox is likely to be a major benefit in the future for **Fuji** Photo Film.

We have covered here some of the other products that should enhance **Fuji**'s profitability in the future. Among the most significant ones are the Digital Color-Art First Proof, the Chemical Free Graphic Arts Film and the Fujix DS-505/DS-515 digital camera, although digital cameras are unlikely to be a profitable mass-market business for some time. In any event, we see **Fuji**'s pioneering developments linked to its strong position in the worldwide photographic film and camera markets as a key benefit for the future.

ID cards help the Australian Golf Union cut (key) strokes
(Unisys develops and implements magnetic stripe card system for members of
the Australian Golf Union)
Automatic ID News Asia, p 28
April 1997
DOCUMENT TYPE: Journal (United States)
LANGUAGE: English RECORD TYPE: Fulltext
WORD COUNT: 362

TEXT:

The Australian Golf Union (AGU) is turning to magnetic stripe cards so its members are no longer handicapped by paper-intensive record keeping. All 500,000 club golfers in Australia will be issued GOLF Link magnetic stripe ID cards, which will be used at the AGU's 1,600 member clubs. The clubs will be linked to a central database that will identify golfers and process handicap data through the use of the ID cards. CitiBank and the AGU are issuing a co-branded credit card that will serve as the GOLF Link card and provide purchasing benefits to cardholders and clubs.

As AGU members strive to cut strokes from their handicap, the association is striving to eliminate keystrokes from its processes.

"GOLF Link takes golf into the 21st century with a sophisticated, accurate and consistent handicapping system that will benefit all amateur golfers," says Dr. Peter Davies, president of the Australian Golf Union. "The beauty of GOLF Link is that it provides Australian golf with a uniform handicapping system at minimal cost to the golfing community. The Australian handicap will be recognized throughout the country, and means that all golfers in this country can compete against each other (with) equitable handicaps."

Golfers will present their cards when they play at any of the member clubs. The cards will be read at the club, which will initiate a database lookup on a host Unisys SMP 61000 symmetric multiprocessor computer. The lookup will verify the golfer's **membership**. **Cards** will also be **swiped** when the golfer completes his/her round, and the score entered on a terminal at the club. This will provide scoring information the computer system needs to compute handicaps.

photo omitted

The card eliminates the need for a "letter of introduction" golfers use to visit other AGU clubs. Users of the CitiBank GOLF Link card will automatically be enrolled in a customer loyalty program, and CitiBank will pay the AGU a commission on every dollar spent with the card.

Unisys was awarded an \$8.5 million contract to develop and implement the system. Hardware installation is underway, and the first clubs are scheduled to go on line this June. Full implementation is scheduled for completion in June 1998.
